

Round 3 Submission Focus

What's Next: Round 3 – Working Prototype Submission

For this round, you are expected to submit a working prototype (MVP) that clearly demonstrates functionality, execution, and viability, with a focus on the following:

What to Focus On

Functional MVP with a clean, documented codebase (GitHub hygiene is a selection criterion)

Real testnet or mainnet transactions with smart contract implementation (for x402 projects: testnet transactions or mainnet-ready flows)

Defined business model or monetisation hypothesis — who pays, how much, why Algorand

Notes from Twitter Space-

picking ones that are closest to the market. market readiness. 3 tracks are not problem statements, but they are lenses. agentic commerce, autonomous payments, agents pay one another, one live transaction where agent pays another without human transaction, x402 on testnet, escrow, lending, compliance, regulatory plugin. everyone competing with one another. describe less about your problem but race is about who is fastest to solving the problem and bringing the solution to the table. mvp is not only fancy tech but what you are solving. what are we solving, is it really solving the problem in correct and necessary way. mvp/ solution should solve a real problem. if you are able to get one person who is from your market to use it, you are good to go. do something which is of value and ensure someone is able to extract value from your solution. looking for a live product- path for mainnet. who is gonna pay for your product. entrepreneurial lens. have a business plan around it. built product ready to take to market and how will you generate revenue from it. you should know pricing details. whether you are making a realistic product. whenever you build something, if you are making something, dont push it on them, but speak to them whether they want to use them, why they would, and if the product would really help them. challenge the devs about is this even feasible. strongly consider to have a touch point in listening to your customers. think that you are building something which you will want to continue building beyond the hackathon. how you can be mainnet ready. how you can make users use your product. around 76 teams. office hours. 15 mins. come with future roadmap for round 3. integration tools. only mature teams with ready projects just for mentorship and pitching will be considered. use tools in algorand. a lot of x402 projects, so make sure your project stands out. have clarity on what you are building. be able to communicate what you are building. what about the agentic payment is different or unique. make sure target audience is clear. one of the team has same product/ solution as me. maintain good github hygiene. keep staging and testnet environment always ready. create complete meaningful transaction flow with every significant user calls. show not only happy path and but the whole system. you should show what all transactions matter. readme should allow people to understand your project and they should be able to contribute to it. architecture. what is the differentiators for winning- should have integrations in ecosystem effectively. projects building for startup vision and long term perspective. x402 projects- custodial wallet, how ai agents will identify themselves, how they will prove them. crypto people benefitting vs normal non crypto person can access it. people have inefficiencies but could solve them. not the smartest idea, but project

which is real and make money. build for real world. should be technologically sound but people should use them. stop planning, start building.
